

# EAHORC Heats

EAHORC heats are created with, and made for use only with, the Race Coordinator ("RC") software, and at the users risk.

To use these heat rotations simply select the 'custom rotation' in the heat manager and add each of the files provided. They cover 7 through 32 drivers. Further files are being constructed as needed.

The drivers will complete 2 heats back to back. If you position your driver stations correctly it will be possible for the drivers to quickly shuffle on left or right on change-overs, whilst the lane changes of the cars themselves insures you will not have the same ones around you.

When drivers return the rotation mixes them so that they will not face the same three opponents. In a lot of cases they will face only one, and the lane rotation and change-over makes it unlikely they will be on track side-by-side.

The benefits of this rotation are many and obvious, and thanks to the RC project it is now possible to use them without delay on race day.

Enjoy!
